NEW EDITION

TNM Classification of Malignant Tumours
SEVENTH EDITION

Edited by LESLIE SOBIN, MARY GOSPODAROWICZ and CHRISTIAN WITTEKIND

The TNM system is the most widely used means for classifying the extent of cancer spread. TNM Classification of Malignant Tumours, 7th Edition provides the new, internationally agreed-upon standards to describe and categorize cancer stages and progression. Published in affiliation with the International Union Against Cancer (UICC), this pocket guide contains important new and updated organ-specific classifications that oncologists and other professionals who treat patients with cancer must use to adequately classify tumours for prognosis and treatment.

The major alterations addressed in the 7th Edition concern carcinomas of the oesophagus and the gastroesophageal junction, stomach, lung, appendix, biliary tract, skin carcinoma, and prostate. There are several new classifications: gastrointestinal carcinoids (neuroendocrine tumours), gastrointestinal stromal tumour, upper aerodigestive mucosal melanoma, Merkel cell carcinoma, uterine sarcomas, intrahepatic cholangiocarcinoma, and adrenal cortical carcinoma.

A new approach has also been adopted to separate stage groupings from prognostic groupings in which other prognostic factors are added to T, N, and M categories. These new prognostic groupings as well as the traditional anatomic groupings are presented for oesophagus and prostate.
